

Chrome surfaces

CLEANING AND CARE INSTRUCTIONS

General information

Always clean metal surfaces carefully and without scrubbing, so as not to scratch the surface. Never use cleaning agents that contain granular substances, acetic acid, hydrochloric acid, formic acid or chlorine bleach. Microfiber cloths and scouring pads can also damage the chrome surface.

- Remove light dirt with lukewarm water
- Remove heavy dirt with washing-up liquid
- Use special chrome cleaners for stubborn dirt

Rinse off all cleaning fluids well to prevent stains from forming. Wipe in the direction of the polishing to get the best results. With chrome, always be careful not to scratch it. After wet cleaning, wipe the chrome surface with a dry cloth to prevent water spots from forming.
